Final Practice

Develop a console command line application that:

   - loads in memory a "dictionary" file containing a list of words (one word per line) [dictionary.lst]

   - asks the user for a number

   - prints *all* the words of the dictionary that correspond to that number, according to the telephone keys.

For example, if the dictionary contains "hello", and the user entered 43556, then the program prints out "hello".
